Workspace

- All of the objects in your environment

    ```
    ls()
    ```

- Can all be saved in one file together (and loaded later)

    ```
    save.image("20180626.RData")
    ```

- List of loaded libraries is NOT saved

- Remove an object from environment

    ```
    rm(x)
    ```

- Asked about saving image each time you quit R
  - If yes, saves ".RData", which gets reloaded next session

Working Directory

- Where does R think it is? What directory?
  - Determines path for reading and writing files
- Can set the working directory
- Better to use RStudio projects
  - Working directory is where the .Rproj file is
  - Keep all files contained in one directory
  - Makes it easier to share code
